\_2\_

- 6. Once a meteorological station has been put up, all sorts of specialists arrive and begin to conduct all kinds of studies. After the third year of meteorological studies, construction materials come in. Nobody asks for the consent of the kolkhoz administrator.
- 7. Each AO has its own fuel tank, which is put in side-by-side with that of the kolkhoz. It is attached to the pump beside the dispatcher's platform by a special channel. Each AO receives a special allotment of fuel for lighting and signal system.
- 8. A Dos-Avio building is now constructed near the AO. This usually accommodates twenty-five to thirty persons. A food supply station and a repair shop, with a collection of tools for minor repairs, are installed beside it. Within the kolkhoz a Dos-Avio cell is established. Its duties are to guard the AO. Normally, during the month of August, these airfields are visited by Dos-Avio machines of the region. Members of the kolkhoz of the Dos-Avio cell are offered a chance to go up in the planes as passengers. During the winter months, lecturers come to the kolkhozes to familiarize the members of the Dos-Avio cell with airplane mechanics and the servicing of airfields. During these conferences, a special commission chooses certain young people who have made the most progress in the work of the local cell. These youngsters are sent to the aviation factories.
- and Siktivkara were connected with the forestry kolkhozes and belonged to the Dos-Avio of the Polar Region. These were built on the "pair" system--that is, one AO for each two kolkhozes situated near each other. These AO have special beacons for identification. These are built in the form of belvederes and are located along the runways. The kolkhozes are compelled to undertake the upkeep of the AO during the winter, by putting a group of workers at the disposal of the kolkhozes Dos-Avio cell.
- 10. In fact, the AO must be kept ready for use at all times, and military aircraft frequently do make use of them. In May 1953 the number of AO in the Arctic Circle reached 114 and nine others were in construction 25X1 The AO system is mainly developed in the first and second industrial regions of the USSR--in other words, in the industrial regions of Priuralsk, sic Turalsk, and Central Siberia, which commences at Kazan and ends at Chita. There, the system is not based on the kolkhoz but on the factory, as a unit.
- 11. Membership of Dos-Avio, throughout the USSR, reaches nearly half a million. Among this number are nearly 125,000 former members of the air army, about 300,000 workers and employees in aviation factories, and about 400,000 mechanics and skilled workmen of different machinery factories.
- 12. The breadth of the different AOs varies. It is never less than forty-five meters for AOs of the fourth category. Those of the first category may be seventy-five meters wide. In case of mobilization, a fourth category AO, if in the forward part of the zone of communications should have a crew of twelve persons permanently on duty, four of whom may be women. 25X1 importance attached to these AOs by the Soviet administration.

  In case of war, they are expected to play a very large role. 25X1

13.	One special group is known as "SAO" (Secrietnei Aérodrom Odintska" 25X1 These are to be used in compatting partisans, 25X1
·,	whom the Soviet administration appears to expect to rise within the USSR in the event of war. After their construction, these SAO are covered with fifty centimeters of each sig/and their subterranean gasoline tanks are carefully concealed. These SAO are somewhat shorter than other AOs. Frequently they are only 750 meters long. At present, there are about a hundred SAO" in Byelcrassia and Lithuania.
